1. Executive Summary

DFIR-Rapid: Digital Forensics and Incident Response as a Service

Cyberattacks don't wait, but most Small and Medium Enterprises (SMEs) in Cambodia and the ASEAN region are completely unprepared to respond. When a breach occurs, these businesses face a painful reality: traditional forensic investigations are slow, expensive, and out of reach.

DFIR-Rapid changes that. We are a specialized DFIR-as-a-Service that streamlines the forensic investigation workflow — from evidence collection to reporting — delivering critical incident insights in hours instead of weeks. By integrating proven open-source forensic tools into one seamless, secure pipeline, we eliminate the complexity and prohibitive costs that have traditionally locked SMEs out of professional incident response.

We are targeting a largely untapped market of digital businesses with 10 to 200 employees, specifically across the e-commerce, fintech, and SaaS sectors in Cambodia and the wider ASEAN region. Our go-to-market strategy combines direct B2B outreach, strategic IT service provider partnerships, and free pilot deployments to drive rapid adoption.

By leveraging powerful open-source tooling, we keep development costs low while offering a highly scalable revenue model: predictable monthly subscriptions ($200–$500) and flat-rate per-incident packages ($800–$1,500). DFIR-Rapid is positioned to become the premier forensic response partner for the underserved segment powering ASEAN's digital economy.

2. Business Description

We provide a specialized, on-demand Digital Forensics and Incident Response service. Our team deploys structured investigation methodology to respond to cyber incidents, collect and preserve digital evidence, reconstruct attack timelines, and deliver clear findings that support both technical remediation and business decision-making.

2.1 Business Background

2.1.1 Problem Statement

The current threat landscape is defined by an unprecedented surge in sophisticated cyberattacks, ranging from destructive ransomware to targeted phishing campaigns, which increasingly outpace the defensive capabilities of modern organizations.

For many businesses, particularly Small and Medium Enterprises (SMEs), maintaining a dedicated, in-house cybersecurity team is financially prohibitive and operationally complex. This creates a critical "security gap" characterized by sluggish incident detection and delayed response times, which significantly heightens the risk of catastrophic financial loss and permanent reputational damage.

Furthermore, the market for Digital Forensics and Incident Response (DFIR) remains largely inaccessible to smaller organizations due to the high costs associated with traditional high-end consultancies, leaving them vulnerable and without a clear path to recovery following a breach.

2.1.2 Solution

A **"DFIR as a Service" model** that bridges this accessibility gap by providing a scalable, subscription-based solution that delivers elite-level security capabilities without the overhead of internal infrastructure.

The service provides immediate, on-demand **incident response support** to contain active threats, followed by a rigorous **digital forensics investigation** to identify the root cause and extent of the compromise.

Beyond immediate recovery, we provide comprehensive **post-incident analysis** and high-fidelity reporting that translates technical findings into actionable business intelligence. By offering continuous support and iterative security improvements, we ensure that our clients are not only restored to a secure state but are also better equipped to defend against future adversaries through increased resilience and forensic readiness.

2.2 Mission, Vision, Values

Mission: Simplify digital forensics for SMEs

Our mission is to take the complexity out of digital investigations for small and medium-sized businesses. Typically, digital forensics is seen as a complicated and expensive field reserved only for giant corporations. We are changing that by providing easy-to-understand tools and expert support that allow smaller companies to identify, contain, and recover from cyberattacks without needing a massive IT department.

Vision: Become ASEAN's leading DFIR service

We aim to be the go-to name for digital forensics and incident response across the entire ASEAN region. As Southeast Asia's digital economy grows, so do the threats. Our goal is to build a trusted, unified service that protects businesses from Bangkok to Jakarta, setting the regional standard for how cybercrimes are investigated and resolved.

Values: Integrity, automation, accessibility

Integrity: In the world of forensics, the truth is everything. We handle every piece of digital evidence with total honesty and transparency, ensuring that our findings are accurate, unbiased, and legally sound.

Automation: We believe in working smarter. By using smart technology to handle repetitive tasks like log collection and initial scanning, we speed up recovery times and reduce human error, allowing us to stop threats faster.

Accessibility: High-level security shouldn't be a luxury. We are committed to making our services affordable and easy to use, ensuring that any business—regardless of its budget or technical skill—can defend itself against modern cyber threats.

2.3 Business Structure & Model

A. Business Structure

This business is structured as a **B2B (Business to Business) Hybrid Startup**, combining the SaaS component such as leveraging tools like Wazuh, with a human-led **Incident Response Team**.

B. Business Model

To ensure both predictable recurring revenue and the ability to capture high-value emergency work, we utilize a **bi-pillar revenue model** tailored for the SME market:

1. Tiered Subscription Plans (Monthly/Yearly)

This provides clients with proactive monitoring and guaranteed "Forensic Readiness."

- **Basic Tier:** Automated log collection and monthly security health reports. Ideal for micro-SMEs needing basic compliance.
- **Standard Tier:** 24/7 automated alerting with a defined **SLA** for initial triage. Includes a set number of "Investigation Hours" per year.
- **Premium Tier:** Full Managed Detection and Response (MDR) with priority 1-hour response times, deep-dive File Integrity Monitoring (FIM), and quarterly threat hunting.

2. Pay-Per-Incident (Emergency Response)

For organizations that are not currently subscribers but find themselves mid-breach, we offer an **On-Demand Emergency Response** service. This is priced at a premium "Burst Rate" and serves as a high-margin entry point. These clients are typically transitioned into a subscription plan post-incident to prevent recurrence.

2.4 Business Life Cycle

Stage	Status
Development	Current
Introduction	Demo phase

Growth	Post-launch
Maturity	Future
Decline	N/A

3. Market & Industry Analysis

3.1 Industry Outlook

- **Rapid SME Digitization:** Small and medium businesses across the ASEAN region are moving their operations online faster than ever. While this helps them grow, it also opens up more "digital doors" for criminals to enter.
- **Increasing Cyberattacks:** As more business happens digitally, attacks like ransomware and data breaches are becoming more frequent and aggressive. Smaller companies are now primary targets because hackers know they often have weaker defenses.
- **Rising Regulatory Pressure:** Governments are no longer staying quiet about cybercrime. New rules, like the **ASEAN Digital Economy Framework (DEFA)**, are pushing businesses to meet higher security standards or face heavy penalties.

3.2 Technology Trends & Demands

A. Trends

SIEM Adoption: More companies are using Security Information and Event Management (SIEM) tools. Think of this as a "digital security guard" that watches all your logs in one place to spot suspicious behavior instantly.

Automation in Cybersecurity: Instead of waiting for a human to notice a problem, we use smart software to automatically block threats the moment they appear. This makes the response much faster and more accurate.

Cloud + Hybrid Environments: Businesses are moving their data to the cloud (like Google Drive or AWS). Our tools are designed to protect both the physical computers in your office and the data stored on the internet.

B. Demands

Fast Response Needed: When an attack happens, every minute counts. Customers want a service that reacts immediately—not one that takes days to get started.

Low-Cost Solutions Preferred: Most SMEs don't have a million-dollar budget for security. They are looking for "big company protection" at a price they can actually afford on a monthly basis.

Easy-to-Use Services: Business owners don't want to look at complicated code. They need a simple dashboard that shows them exactly what's happening in plain English.

3.3 Regulations Requirements

Incident Reporting Requirements: New laws in countries like Singapore, Malaysia, and Vietnam now require businesses to report data breaches to the government within a very short window (often 24–72 hours). Our service helps automate this reporting.

Data Protection Laws: We follow the ASEAN Framework on Personal Data Protection. This ensures that when we investigate a hack, we handle customer data legally and safely, helping our clients stay compliant with local privacy rules.

3.4 Competitive Analysis

Type	Weakness
CrowdStrike/SentinelOne	Too expensive
Local consultants	Manual, slow
DIY tools	No integration

4. Product and Service Analysis

4.1 Service Offerings

A. Incident Response (IR) Service

This is our "emergency room" service, activated the moment a threat is suspected. Our team performs rapid initial triage to contain the attack and stop it from spreading. We use a structured, high-pressure investigation process to scope the incident, ensuring that your business operations are protected while we begin the recovery phase.

B. Digital Forensics Investigation

We conduct a systematic "digital autopsy" to identify and preserve evidence from affected computers, servers, and networks. By analyzing logs and system data, we reconstruct the entire attack

chain—from the very first second the attacker entered your network to their last known activity. This ensures no "backdoors" are left behind.

C. Malware & Evidence Analysis

Using specialized automation tools, we study the behavior of malicious code (malware) to see how it tried to hide and what data it targeted. We review security event logs to calculate "dwell time"—exactly how long the attacker was inside your systems—providing a clear picture of the risk your data faced during the breach.

D. Business Impact Assessment

We translate complex technical jargon into plain business language. We answer the most important questions for business owners: *What specific data was stolen? Which systems are unsafe? What are our legal obligations under ASEAN data laws?* This assessment helps you understand the true financial and operational cost of the incident.

E. Incident Reporting & Recovery Roadmap

The final deliverable is a professional, high-standard forensic report. This document includes a clear timeline, root cause analysis, and a prioritized "Roadmap to Recovery." We don't just tell you what went wrong; we provide the exact steps needed to harden your defenses and prevent the same attack from happening again.

4.2 Service Level Agreement

4.2.1 Response Time Commitment

Priority	Severity	Description	Target Engagement
P1	Critical	Active breach, ongoing data exfiltration, ransomware deployed	With in 4h
P2	High	Confirmed incident, contained but unresolved	Within 24h
P3	Medium	Suspected incident or post-incident forensic review	WIthin 48-72h
P4	Low	Minor anomaly, no confirmed breach, general security inquiry	With in 5-7days

- Full Unified Forensic Report delivered within agreed timeline after investigation completion
- Status updates provided at each workflow milestone: after triage, after evidence collection, before report delivery

4.2.2 Scope of Service

What is included:

- Incident intake and triage
- Digital forensics investigation
- Malware and log analysis
- Attack timeline reconstruction
- IOC identification and documentation
- Business and financial impact assessment
- DFIR-RAPID Unified Forensic Report delivery

4.2.3 Confidentiality & Non Disclosure Agreement (NDA)

- NDA signed before every engagement begins
- All case findings, client data, and communications are strictly confidential
- Case details — including incident type, affected systems, and IOCs cannot be disclosed to any third party without written client consent
- DFIR-RAPID staff access to case data is limited to the assigned investigator only

4.2.4 Data Handling & Retention

All collected evidence — disk images, logs, memory captures — stored encrypted and access-controlled throughout the case

- Chain of custody maintained for every artifact from collection to case closure
- Case data and evidence retained for minimum 12 months after case closure
- All client data securely deleted after the agreed retention period ends
- Only the assigned investigator has access to case evidence during the investigation

4.2.5 Liability & Limitations

- DFIR-RAPID is responsible for maintaining evidence integrity throughout the engagement
- DFIR-RAPID is not liable for damage that occurred before the engagement began
- DFIR-RAPID findings are investigative conclusions based on available evidence — not court-admissible legal certification
- DFIR-RAPID is not liable if evidence arrives already compromised or partially destroyed before engagement

4.2.6 Payment Terms

- Payment terms defined per service tier: Basic / Standard / Premium / Retainer
- Retainer clients billed monthly in advance for priority access

- Per-incident clients billed upon report delivery
- Late payment terms and dispute resolution process defined per contract

4.2.7 Evidence Integrity and Chain of Custody Protocols

Forensic Preservation Standards: DFIR-RAPID ensures all original evidence remains unaltered by using **write-blocking technology** and working exclusively on forensic copies. This "by-the-book" approach guarantees that data integrity is maintained from the moment of collection.

Chain of Custody (CoC) Documentation: Every digital artifact is tracked in a secure **CoC Ledger**. To ensure evidence is court-ready and tamper-proof, we document:

- **Identification:** Original file path and source.
- **Verification:** Unique **SHA-256 hashes** for data integrity.
- **Tracking:** A complete log of the collection method, timestamps, and handling analyst.

Client Responsibilities: The Client is responsible for preserving affected systems and avoiding restarts or changes before our team begins triage. If evidence is received in a compromised state, DFIR-RAPID will document the condition and proceed on a "Best-Effort" basis, noting that final investigative findings may be limited.

4.2.8 Engagement Termination and Handover

Notice Period and Termination Rights Either party may terminate the engagement at any time upon providing written notice to the other party. Upon receipt of a termination notice, DFIR-RAPID will immediately cease all active forensic collection and analysis to mitigate further costs to the Client.

Final Deliverables and Partial Findings If an engagement is terminated mid-investigation, DFIR-RAPID will provide a **Partial Findings Summary**. This document will include:

- **Work Progress:** A detailed list of completed tasks and the status of ongoing analysis.
- **Interim Results:** Any actionable threat intelligence or identified indicators of compromise (IoCs) discovered up to the point of termination.
- **Evidence Handover:** A secure transfer of all collected digital artifacts and the associated **Chain of Custody** documentation to ensure the Client can continue the investigation with another provider if necessary.

Financial Obligations The Client remains responsible for all professional fees and expenses incurred for work performed and resources deployed up to the effective date of termination.

4.2.9 What We Do NOT Include

To maintain clarity about scope and set accurate client expectations, our service does not include:

- 24/7 continuous security monitoring (SOC / SIEM services)
- Proactive threat hunting or real-time alerting
- Network intrusion prevention or firewall management
- Court-admissible legal forensic certification
- Advanced malware reverse engineering at expert level

4.3 Unique Value Proposition (UVP)

We provide small and medium enterprises with **affordable, automated digital forensics** that cut incident response times by **60%** and lower costs by **75%**. Our service gives SMEs the same high-level investigative power as a global corporation, at a fraction of the price.

Three Core Value Drivers

1. Speed: From Days to Hours

In a cyberattack, every minute costs money. We use automation to turn slow, manual tasks into instant actions.

- **Rapid Evidence Collection:** We gather critical data in minutes instead of hours.
- **Smart Workflows:** Our pre-built investigation paths guide the process so no time is wasted wondering "what's next."
- **Instant Reporting:** We generate professional summaries immediately so you can make informed decisions fast.

2. Affordability: Expert Protection on an SME Budget

We've removed the "expert-only" price tag from high-end forensics by changing how the service is delivered.

- **Lower Labor Costs:** Because our system automates the heavy lifting, you don't have to pay for hundreds of manual consultant hours.
- **The Power of SaaS:** Our shared cloud infrastructure allows you to access elite tools without buying expensive hardware.
- **No Specialist Needed:** You get the results of a forensic expert without the high cost of hiring one full-time.

3. Integrity: Professional-Grade Evidence

Speed and low cost don't mean a drop in quality. We ensure your evidence is handled with "by-the-book" accuracy.

- **Zero Contamination:** Our automated process ensures that digital evidence is never accidentally changed or deleted.
- **Locked Chain of Custody:** We track every step of the investigation, creating a secure history of who touched what data and when.
- **Court-Ready Results:** Our evidence packages are organized to meet strict legal standards and regional rules (such as **NBC** and **ASEAN** data regulations), making them ready for insurance claims or legal needs.

5. Operations & Infrastructure

5.1 Investigation Flow

Step 1: Incident Intake

The investigation lifecycle begins the moment a client detects an anomaly or potential breach and alerts the DFIR-Rapid service. Upon notification, the system immediately registers a new case, generating a unique tracking identifier to maintain a strict chain of custody from the outset. During this initial phase, our service automatically assesses the scope and severity of the incident based on client inputs and preliminary telemetry. This rapid triage ensures that resources are prioritized effectively, matching the urgency of the response to the critical nature of the threat.

Step 2: Triage & Containment Guidance

Once the case is registered, the workflow shifts to immediate remote triage to minimize the "blast radius" of the attack. DFIR-Rapid analysts and automated scripts interact with the client's environment to identify precisely which systems, networks, or accounts have been compromised. Simultaneously, our service provides the client with step-by-step, actionable guidance on immediate containment. This critical intervention helps the SME isolate infected hosts and block malicious traffic, stopping the attack in its tracks before evidence collection begins.

Step 3: Evidence Collection

With the threat temporarily contained, our service initiates a rigorous, forensically sound evidence collection process. Leveraging pre-deployed agents or rapid-deployment scripts, DFIR-Rapid gathers critical volatile and non-volatile data, including disk image acquisitions, system logs, and live memory captures where applicable. To ensure this data is admissible and reliable, every piece of gathered evidence is automatically hashed, time-stamped, and securely documented within the centralized case platform, preserving data integrity.

Step 4: Forensic Analysis

This phase is the technical core of the operation, where the collected data is processed to uncover the attacker's footprint. The analysis engine dissects system artifacts, correlates disparate log sources, and reconstructs a master timeline of the security event. By mapping out exactly how the breach occurred, from initial access to lateral movement, our system identifies the root cause and extracts

Indicators of Compromise (IOCs) or traces of malware. This deep dive transforms raw data into a clear story of the attack.

Step 5: Reporting & Recovery

In the final phase, technical findings are translated into clear business intelligence and recovery steps. DFIR-Rapid conducts a business impact assessment to help the client understand what data or systems were targeted. This culminations in a structured, professional incident report that details the attack lifecycle and findings for both technical teams and executive stakeholders. Finally, the report delivers tailored recovery and infrastructure hardening recommendations, ensuring the SME can return to normal operations and successfully defend against similar future attacks.

5.2 Technology Stack and Equipment

A. Forensic Investigation

- Autopsy : disk image analysis and artifact examination
- FTK Imager : forensic disk image acquisition

B. Memory Forensics

- Volatility : memory capture and analysis of running processes and loaded artifacts

C. Log Analysis

- Chainsaw : rapid parsing of Windows event logs for attacker activity
- ELK Stack : centralized review of system, application, and security event logs

D. Malware Analysis

- Any.run : interactive malware behavior sandbox
- VirusTotal : file and IOC reputation checking across multiple engines

E. Evidence Acquisition

- Write blockers : ensures original evidence is never altered during collection
- Encrypted external storage : secure, access-controlled evidence storage throughout the case

F. IOC & Threat Intelligence

- MISP : documenting and sharing indicators of compromise
- OpenCTI : cross-referencing threat intelligence against case findings

G. Case Management

- TheHive : tracking case lifecycle, evidence, communications, and investigator actions from intake to closure

H. Reporting

- DFIR-RAPID Unified Forensic Report template : standardized professional report delivered at the close of every engagement

5.3 Suppliers

Open-Source Community Tools

The project relies heavily on open-source software maintained by global communities.

These communities act as indirect suppliers by providing:
- Regular updates and security patches
- Documentation and technical support
- New features and improvements

This approach:
- Reduces development cost
- Increases reliability (battle-tested tools)
- Allows focus on integration and automation

6. Marketing Strategy

6.1 Customer Segmentation

Our primary market is organizations in Cambodia that lack internal Digital Forensics and Incident Response capability

Target segment	Why They Need Us
SMEs in Cambodia	**No dedicated security team, most vulnerable to unstructured post-incident response**
FMI (Fintech)	High-Value data target , regulatory obligation to investigate and report breached
Ecommerce business	Payment data island customer records are prime attack target
NGO’s & Development organization	Often targeted in phishing campaigns; limited IT resources and high data sensitivity.

6.2 Positioning

DFIR-Rapid is positioned as an **affordable, easy-to-use Digital Forensics and Incident Response (DFIR) service specifically designed for small and medium enterprises (SMEs)** that lack dedicated security expertise.

DFIR-Rapid sits between:

Segment	Problem
Enterprise security platforms	Too expensive and complex
Manual investigation / consultants	Too slow and inconsistent
Free tools (DIY)	Too fragmented and difficult

6.3 Marketing Mix

A. Online Marketing (Social Media & Website)

- Focus on **LinkedIn** for B2B outreach — post weekly content on cyber threats in Cambodia, incident response tips, and local threat news
- Use **Facebook** (dominant in Cambodia) to run awareness posts targeting SME owners and IT managers
- Write short blog articles like *"What to do in the first hour of a cyberattack"* to build credibility and SEO

B. Partnerships with IT Service Providers

- Approach local IT companies, ISPs, and managed service providers (MSPs) who serve SMEs but have no DFIR capability ,offer them a referral or white-label arrangement
- Partner with accounting/ERP software firms whose clients handle sensitive financial data
- Connect with law firms that handle commercial disputes ,they occasionally need digital evidence support

C. Cybersecurity Awareness Campaigns

- Run free short webinars or Facebook Live sessions on topics like *"How ransomware works"* or *"Signs your business has been breached"*
- This builds trust and positions you as the go-to expert before clients even need you

D. Direct Outreach to Businesses

- Identify target SMEs, fintechs, and NGOs via LinkedIn and local business directories
- Send a short, professional email or LinkedIn message introducing your service , focus on the *risk they face*, not just what you sell
- Attend local business networking events (CAMFEBA, EuroCham, AmCham Cambodia)

E. Workshops and Seminars

- Partner with co-working spaces, universities, or chambers of commerce to host **paid or free half-day workshops**
- Topics: incident response basics, how to preserve digital evidence, Cambodia's cyber threat landscape
- These double as lead generation attendees become potential clients

6.4 Growth Plan

A. Expanding Service Offerings

- Introduce **Cyber Readiness Assessment** pre-incident evaluation of a client's security posture and response readiness
- Add **Tabletop Exercise facilitation** simulated incident scenarios to train client teams
- Develop a **SME Starter Package** lightweight forensic readiness kit and basic IR policy template for clients with no existing security framework
- Long term: explore **vCISO (Virtual Chief Information Security Officer)** advisory services for clients wanting ongoing strategic security guidance

B. Entering New Markets

- **Year 2:** Expand service delivery to cover **Myanmar and Laos** — neighboring markets with similar digital maturity gaps and limited local DFIR capability
- **Year 3:** Target larger markets with growing SME sectors and increasing regulatory pressure around data breach reporting
- Position DFIR-RAPID as an **ASEAN-focused boutique DFIR firm** serving markets underserved by large global cybersecurity companies

C. Building Partnerships

- Partner with **law firms** handling commercial disputes and cybercrime cases requiring digital evidence
- Partner with **cyber insurance providers** entering the Cambodian market become their preferred DFIR response vendor
- Build referral relationships with **IT managed service providers** across Cambodia and the region
- Engage with **government and regulatory bodies** — NBC (National Bank of Cambodia), MPTC to position DFIR-RAPID as a trusted response resource

D. Continuous Improvement of Technology

- Migrate case management to a dedicated forensic service as caseload grows replacing early-stage tools with enterprise-grade solutions
- Build a proprietary **IOC database** from cases handled — creating a Cambodia and ASEAN-specific threat intelligence resource
- Invest in automation for log analysis and timeline reconstruction to reduce investigation time and improve consistency

- Regularly evaluate and adopt new forensic tools as the threat landscape and attack techniques evolve

7. Financial Plan

7.1 Cost Structure

A. Initial Setup

Item	Estimate cost
Forensic tools & software licenses	$1500-$3000
Hardware (workstation, write blockers, storage)	$2000-$3500
Case management platform	$500-$1000
Website & branding	$500-$1000
Legal & business registration	$300-$500
Total	$4800-$9000

B. Operational Cost

Item	Estimate cost
Staff salaries	1500-3000
Tools subscription	200-400
Marketing and Outreach	200-300
Office or - working space	200-400
Others	100-200
Total	2200-4300

7.2 Revenue Model

A. Pricing Strategy

Pricing Tiers:

Tier	Scope	Price
Basic	Triage + Incident Snapshot + Summary Report	$500-$800
Standard	Full Investigation + Unified Forensic Report	$1500-$2500
Premium	Full Investigation + Compliance & Legal Support	$3000-$5000

Tiered model designed to be accessible to SMEs while reflecting the value of professional forensic investigation Basic / Standard / Premium.

Per-Incident Pricing (No Subscription):

- One-time investigation: $1,500 per incident
- Evidence collection only: $500
- Report generation from existing evidence: $300

B. Revenue Projections

Year	Estimated cases	AVG revenue / case	Total revenue
Year 1	5-10	$1500	7500-15000
Year 2	15-25	$2000	30000-50000
Year3	40 -55	$2500	100000-137500

7.3 Financial Statements

A. Income Statement

Year 1:

Item	Amount
Revenue	$7,500 – $15,000
Operating Cost	$39,000
Initial Cost	$7,000
Net Profit	**–$38,500 to –$31,000**

Year 2:

Item	Amount
Revenue	$30,000 – $50,000
Operating Cost	$39,000
Net Profit	**–$9,000 to +$11,000**

Year 3:

Item	Amount
Revenue	$100,000 – $137,500
Operating Cost	$39,000
Net Profit	**$61,000 to $98,500**

B. Cash Flow Projections Insight

- ➢ Year 1: Negative cash flow (investment phase)
- ➢ Year 2: Break-even phase
  - **Break-even point:**

    39,000 ÷ 2,000 (avg-per-case) ≈ 20 cases/year

  - Interpretation: We need **~20 cases/year to break even** and grow
- ➢ Year 3: Positive cash flow and growth

8. Proof of Work

8.1 Scenarios & Demonstration

[Refer to the video and its report submission]

8.2 Result (Deliverables to Clients/SMEs)

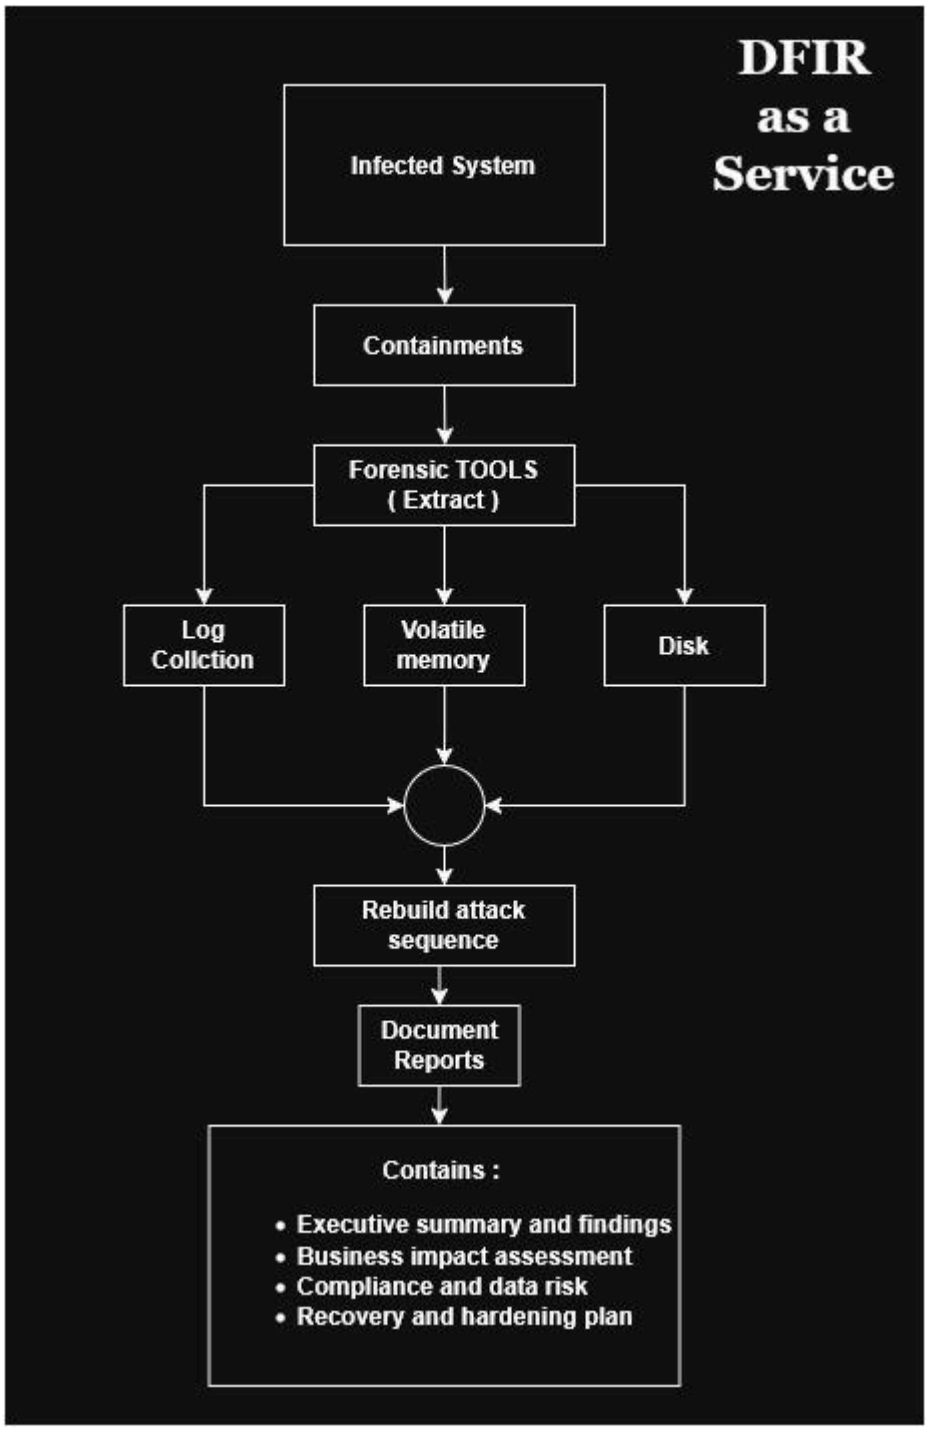

Generated Report Includes:

- Executive summary
- Timeline of attack
- Evidence list (with hashes)

- Root cause analysis
- Impact assessment
- Recommendations

9. Appendices

Appendix A: Architecture Diagram

Appendix B: Sample Report

[Content to be inputted]

Appendix C: Glossary of Terms

- DFIR: Digital Forensics and Incident Response
- SME: Small and Medium Enterprise
- SIEM: Security Information and Event Management
- ELK Stack: Elasticsearch, Logstash, Kibana (log management platform)
- Chain of Custody: Documentation tracking handling of evidence
- IOC: Indicator of Compromise
- C2: Command and Control (server used by attackers)
- YARA: Tool for malware identification based on patterns
- PCAP: Packet Capture (network traffic recording)
- MFA: Multi-Factor Authentication
- MITRE ATT&CK: Framework for categorizing cyber attack techniques
