- Law Of E-Commerce

Finding

- Based On NACC : A list of Punishments for cyber criminal for all the categories (Fines, Jail time)
- What Cambodia lacking right now will be Chain of Custody

1. Digital Evidence Integrity & Forensic Readiness Platform

Problem:

In Cambodia, digital evidence is frequently questioned or delayed in court due to unclear authenticity, weak chain of custody, and lack of standardized technical procedures. Investigators and organizations struggle to prove that digital evidence has not been altered from the moment it was collected, leading to lengthy verification processes or evidence exclusion.

Solution:

Develop a Digital Evidence Integrity & Forensic Readiness Platform that cryptographically seals digital evidence at acquisition time. The system automatically generates hashes, timestamps, and an append-only chain-of-custody ledger, while producing court-ready forensic reports that clearly explain evidence integrity and handling. The platform focuses on post-incident investigation and evidence preservation rather than prevention.

Business Idea:

Offer the platform as a licensed forensic tool for banks, fintechs, law firms, NGOs, and enterprises. Revenue models include per-case licensing, enterprise subscriptions for forensic readiness, and professional services such as compliance reporting and forensic training. The product complements existing forensic tools instead of replacing them, lowering adoption barriers.

Future Outlook:

The platform can evolve into a full forensic readiness service, integrate with SIEMs, EDRs, and cloud logs, and support government or judicial deployments. Future extensions may include trusted external timestamping, blockchain anchoring for evidence hashes, and standardized evidence exchange between organizations and investigators.

Technical Depth:

Cryptographic hashing (SHA-256), encryption at rest (AES), hash-chained custody ledger, optional digital signatures, secure storage design, report generation, and audit logging.

Market Relevance:

Growing digitalization in Cambodia increases legal disputes involving digital evidence. Organizations need cost-effective, trustworthy solutions to reduce legal risk and investigation delays.

Forensic Tie:

Core digital forensics principles: evidence integrity, chain of custody, tamper detection, documentation, and court-admissible reporting.

2. OSINT & Blockchain Scam Investigation Platform (Post-Incident Cybercrime Analysis)

Problem:

Cambodia faces widespread cybercrime involving scams, call centers, online fraud, and crypto-based money laundering. After incidents occur, investigators often have fragmented evidence and lack structured tools to link phone numbers, domains, social media accounts, and blockchain wallets into coherent cases that can support legal action.

Solution:

Build an OSINT and Blockchain-based Scam Investigation Platform that assists forensic investigators in post-incident analysis. The system collects public data related to scam cases, enriches identifiers using OSINT techniques, maps relationships between entities, and traces cryptocurrency transactions linked to fraud. The output is a structured investigative report suitable for law enforcement, legal teams, or compliance units.

Business Idea:

Provide the platform as an investigation-support tool for cybercrime units, banks, fintechs, and law firms. Monetization includes analyst subscriptions, case-based investigation services, and premium modules for blockchain tracing or advanced graph analysis. The platform can also support investigation-as-a-service engagements.

Future Outlook:

The system can expand into a regional cybercrime intelligence platform, integrate with law enforcement databases, enhance blockchain analytics with clustering heuristics, and support cross-border investigations. Over time, it could evolve into a specialized fraud intelligence product for Southeast Asia.

Technical Depth:

OSINT collection and enrichment, entity correlation and graph analysis, blockchain transaction tracing, timeline reconstruction, evidence documentation, and investigative reporting.

Market Relevance:

Cyber scams and crypto fraud are high-impact crimes in Cambodia and the region. There is strong demand for tools that help investigators make sense of scattered digital evidence after incidents occur.

Forensic Tie:

Post-incident digital investigation, evidence correlation, attribution support, financial trail analysis, and structured reporting for legal proceedings.

Final Note

These two projects complement each other:

- Project 1 focuses on evidence integrity and trust
- Project 2 focuses on cybercrime investigation and attribution

Together, they demonstrate:

- Strong digital forensics grounding
- Applied cryptography
- OSINT and blockchain analysis
- Realistic business and market awareness
