

Risk ID	Risk Scenario (The Problem)	Technical Solution (The Tool)	Operational Mitigation Strategy (The Fix)
Risk 1	Ransomware Propagation(Contractor Laptop)	Apache Guacamole(Clientless VDI)	Zero Trust Access: Contractors are isolated from the network. They view the app via a video stream in a browser; no data transfer allowed.
Risk 2	Data Exfiltration(BYOD Mobile)	Exchange ActiveSync(Policy)	Containerization: "Block Copy/Paste" is enforced. Corporate contacts/email cannot be moved to personal apps like WhatsApp.
Risk 3	Lateral Movement(The "Beachhead")	Windows Firewall(Host-Based)	Inbound Block: All peer-to-peer traffic is blocked. Even if a laptop is hacked, it cannot connect to or infect its neighbor.
Risk 4	Physical Theft(Stolen Tablet/Laptop)	BitLocker & Headwind MDM	Encryption & Wipe: Data is mathematically unreadable without the key. MDM triggers a "Remote Wipe" next time the device turns on.
Risk 5	Shadow IT(Unsanctioned Apps)	Windows AppLocker(Whitelisting)	Default Deny: Execution is blocked by default for any file not digitally signed by a trusted publisher (e.g., Microsoft, Adobe).
Risk 6	Privilege Escalation(Admin Abuse)	Wazuh Agent(SCA Module)	Behavioral Monitoring: If an Admin tries to disable Antivirus or clear logs, Wazuh triggers a "Critical Alert" to the SOC immediately.
Risk 7	Man-in-the-Middle(Public Wi-Fi)	Host-Based Firewall(Profile Logic)	Network Profiling: Firewall automatically switches to "Public Profile" (Strict Block) when connected to non-corporate Wi-Fi (e.g., Starbucks).
Risk 8	Zero-Day Vulnerabilities(The Patch Gap)	Tactical RMM(Automation)	Rapid Patching: "Critical" security updates are approved and installed automatically within 24 hours, bypassing manual delays.
